"On Neurogenic Tumors of the Stomach."

Budapest, Magyar Sebészeti, Vol XX, No 1, Feb 67, pages 67-77.

Abstract: [Authors' Hungarian summary] In connection with the detailed description of 2 cases, the neurogenic tumors of the stomach are discussed. The two patients were 45 and 17 years old women. Both patients were hospitalized for gastric bleeding and the benign, ulcerative tumor in the stomach was diagnosed postoperatively. The possibilities of preoperative and intra-operative diagnosis of neurogenic tumors are discussed. In both cases, a subserous vascularization on the extraventricular surface of the stomach was apparent. Since neurogenic tumors may be accompanied by numerous complications including the danger of a malignant degeneration, and they may also have a detrimental effect on hematopoiesis, radical removal as soon as possible and without regard to the age of the patient is considered to be necessary. In some cases, however, if radical surgery with its immediate and late complications represent a greater danger to the patient than the risk of local recurrences which is present when local resection is employed, there is justification for this latter procedure as well. It is considered important that

filtrate are obtained (Ca-morphinate).
Five parts of a mixture consisting of 1
part of alcohol (90°) and 5 parts of ether
are added to the filtrate, mixed, followed
by the addition of 0.4 parts of NH_4Cl , vi-
gorous agitation for 20 minutes, settling
for 16 hours, and then filtration. The mor-
phine remaining on the filter is water wa-
shed, dried at 100° and recrystallized. The
yield is approximately 90 percent. Secondary
alkaloids may be obtained by employing the
above described method. -- A. Vavilova

AUTHORS: Yordanov, D., Engineer, Stefanova, N., Kulchitski,
V. and Iliev, Lozan

TITLE: Introduction of gas cyanization of structural steel
in the State Machine building Plant at Kolarovgrad

PERIODICAL: Mashinostroene, ¹²no. 1, 1963, 12-18

TEXT: The experiments were carried out with round specimens made of medium-carbon alloy steel 40X (40Kh), in U-105 (Ts-105) furnaces at a temperature of 790-840°C. During the gas cyanization, petrol and liquid ammonia entering the furnace from different points were used as the active gas. The petrol was fed in by a drop-per, while the consumption of ammonia was read on a rheometer charged with toluene. Best results with respect to the diffusion of carbon and nitrogen in the surface layer of the specimens were obtained by using an optimum quantity of 250-300 drops/min of petrol and 14 liters/min of ammonia. Under these conditions the layer attains its highest durability and stability, and a higher strength

Card 1/2

Introduction of gas ...

B/005/63/000/001/001/001

of wear than when a liquid cyanization is applied. The duration of the process of saturation must not exceed 100-110 minutes, when the required layer of 0.25 mm thickness is obtained. This process cuts the time of liquid cyanization by 15-20%. During the optimum conditions of the process an ϵ -phase in the structure of the diffusion layer does not exist i.e. the strength of the specimens is higher, and the transition to the core is smoother. The fatigue limit of the specimens was 57.1 kg/mm². The effect of gas cyanization on the deformation of different machine parts was within the admissible limits. There are 12 figures and 6 tables.

Iliev, Lyubomir. Analytically noncontinuable series of Faber polynomials. *Bulgar. Akad. Nauk. Izvestiya Mat. Inst.* 1, 35-36 (1953). (Bulgarian)

In the completed s -plane, let G be a simply connected region containing the point $s = \infty$. Let the function $w = \Phi(s)$, with the expansion $\Phi(s) = s + \beta_1/s + \dots$ in the neighborhood of ∞ , map G conformally and schlicht upon a region $|w| > \rho$ (it is assumed that $\rho < 1$); and let the sequence $\{\Phi_n(s)\}$ be defined by the equation

$$[\Phi(s)]^n = \Phi_n(s) + \beta_{n1}/s + \beta_{n2}/s^2 + \dots$$

For any sequence $c = \{c_n\}$ with $\limsup |c_n|^{1/n} = 1$, the function $f(s) = \sum c_n \Phi_n(s)$ is regular in the region interior to the curve C which is the image of the circle $|s| = 1$ under the mapping $w = \Phi(s)$. Elsewhere [Doklady Akad. Nauk SSSR (N.S.) 90, 499-502 (1953); these Rev. 15, 23], the author has shown that if c belongs to the class NP of sequences whose elements take only a finite number of different values and which are not ultimately periodic, then C is a natural boundary for $f(s)$. He now extends this result in various ways. For example, C is a natural boundary under each of the following conditions: (1) $c_n = a_n + a_{n_1}$, where $a \in NP$ and $a_n \rightarrow 0$; (2) $c_n = a_n i_n$, where $a \in NP$, $b_{n+1}/b_n \rightarrow 1$, and $b_n = O(n^\alpha)$ for some arbitrary constant α ; (3) c is bounded; and for some increasing sequence $\{n_k\}$, $c_{n_k} \rightarrow \alpha$ while, for each fixed positive integer r , $c_{n_k+r} \rightarrow \beta \neq \alpha$; (4) the elements of c take only the values d_1, d_2, \dots, d_s , except for a subsequence $\{c_{n_k}\}$ which is bounded, is bounded away from each d_j , and for which $\limsup (n_k - n_{k-1}) = \infty$. G. Piranian.

Iliev, Lyubomir. Series of Faber polynomials whose coefficients assume a finite number of values. Doklady Akad. Nauk SSSR (N.S.) 90, 499-502 (1953). (Russian)
If $f(s)$ is represented by (1) $\sum c_n \Phi_n(s)$, a series of Faber polynomials whose coefficients c_n assume only a finite number of different values, then either the sequence $\{c_n\}$ is ultimately periodic, or else the boundary of the region of convergence of (1) is a natural boundary for the function $f(s)$. The author's proof follows closely Szegő's proof of the theorem for the special case where (1) is a Taylor series [S.-B. Preuss. Akad. Wiss. 1922, 88-91]. G. Piranian.

Title : The theorem of monophyllous character of finite sums of tri-symmetrical monophyllous functions

Periodical : Dok. AN SSSR 100/4, 621-622, Feb 1, 1955

Abstract : The following theorem is proved: if $f_3(z) \in S_3$, then the $\sigma_n''(z)$ is a monophyllous function in the circle for which $|z| < \sqrt{3}/2$, and the constant $\sqrt{3}/2$ cannot be substituted by a larger number. This theorem is proved for the value $n = 2$. The same theorem was proved previously for $n \neq 2$. Thus the completeness of the theorem is now brought out. S_3 represents the following type of functions: $f_3(z) = z + a_3 z^3 + a_4 z^4 + a_5 z^5 + \dots$. Three references: 1 USSR, 1 Japanese and 1 USA (1923-1952).

Title : About a divided difference of limited monophyllous functions

Periodical : Dok. AN SSSR 100/5, 861-862, Feb 11, 1955

Abstract : A class S of regular and monophyllous functions of the type $f(z) = z + a_2 z^2 + \dots$ and a set $S^{(k)}$ of the k -symmetrical functions of the class S are considered for the purpose of establishing the correctness of the following inequality

$$\left| \frac{f_K(z_1) - f_K(z_2)}{z_1 - z_2} \right| \geq M^2 \frac{1 - \mu^2}{\mu^2}.$$

$$\left[(1 + \mu^k) \sqrt{M^k} - \sqrt{M^k (1 + \mu^k)^2 - 4 \mu^k} \right]^{2/k}$$

Institution : Sofia State University at Sofia, Bulgaria

Presented by : Academician V. I. Smirnov, November 23, 1954

Periodical : Dok. AN SSSR 100/5, 861-862, Feb 11, 1955

Card 2/2 : Pub. 22 - 5/49

Abstract : $\left[(1+\mu^k) \sqrt{M^k} - \sqrt{M^k(1+\mu^k)^2 - 4\mu^k} \right]^{2k} - \left[(1+\mu^k) \sqrt{M^k} - \sqrt{M^k(1+\mu^k)^2 - 4\mu^k} \right]^{2k}$

where $M^k = N$ and $N > |f(z)|$ and $f_k(z) = \sqrt[k]{f(z)}$; $|z| < r$; $|z_1| < r$;
 $z_1 \neq z_2$; $0 < \mu < 1$

The above expression at $M \rightarrow \infty$ can be reduced to the following one:

$$\left| \frac{f_k(z_1) - f_k(z_2)}{z_1 - z_2} \right| > \frac{1 - \mu^k}{\mu^k} \cdot \frac{1}{(1 - \mu^k)^{2k}}$$

Theorem on the Non-Extendability of Power Series

4636:

Il'eff, Ljubomir. Ein Satz über analytische Nichtfortsetzbarkeit von Potenzreihen. C. R. Acad. Bulgare Sci. 10 (1957), 447-450. (Russian summary)

Let $f(z) = \sum_{n=0}^{\infty} c_n z^n$ with radius of convergence 1. The unit circle is a natural boundary if there are a sequence (n_k) and a positive ϵ such that $\limsup |c_{n_k}|^{1/n_k} = 1$; the numbers c_{n_k+h}/c_{n_k} ($h=1, 2, \dots, [sn_k]$) do not have 1 as a limit point; and all the finite sequences $(\gamma_k) = (c_{n_k-1})_{k=1}^{t_k}$, $t_k = [sn_k]$, are "periodic" in the sense that, for some p , $\gamma_k = \gamma_{k+p}$ for $1 \leq k \leq t_k - p$, with $[(t_k - 1)/p] \geq 2$ (so that there are at least two "periods" in each block of coefficients).

 AUTHOR: Iliyev, Lyubomir 80V/20-126-1-2/62
 TITLE: Criterion for the Impossibility of Analytic Continuation of
 Power Series (Kriteriy analiticheskoy neprodolzhimosti
 stepennykh ryadov)
 PERIODICAL: Doklady Akademii naukSSSR, 1959, Vol 126, Nr 1,
 pp 13 - 14 (USSR)

ABSTRACT: Let the series

$$(1) \quad \sum_{n=0}^{\infty} a_n z^n$$

satisfy the condition $\lim_{n \rightarrow \infty} \sqrt[n]{|a_n|} = 1$.

Theorem : If there are two increasing index sequences
 $m_\nu < n_\nu$, $\nu = 1, 2, \dots$, and a number θ , $0 < \theta < 1$, so that

$$\lim_{\nu \rightarrow \infty} \sqrt[n_\nu]{|a_{n_\nu}|} = 1$$

Card 1/2

Criterion for the Impossibility of Analytic Continuation SOV/20-126-1-2/62
of Power Series

$$a_{n_y - k} = a_{m_y - k}, \quad k = 1, 2, \dots, [en_y], \quad (m_y \geq [en_y])$$

and if the number 1 is no condensation point of the numbers a_{m_y}/a_n , then (1) cannot be analytically continued from the unit circle.
